# 1. Introduction

---

## 1.1 Purpose of Document

This Software Requirements Specification (SRS) document formally defines the functional and non-functional requirements of the Smart Medicine Reminder System for DVAGO. The application is designed to help users stay consistent with their medication routines through automated reminders and AI-assisted medicine recognition, reducing the chances of missed or incorrect doses.

This document outlines the system's objectives, scope, and core functionalities, along with the technical requirements that guide both the front-end and back-end development. It also defines the usability expectations and the constraints under which the system must operate. The document is intended to serve as a single reference point that keeps the development effort aligned with the original project goals.

## 1.2 Intended Audience

This document is intended for the project supervisor and co-supervisor, the Final Year Project evaluation committee, the development team, and the DVAGO technical team, should their involvement be required. It is meant to guide the development process, confirm that the implementation stays aligned with the stated objectives, and support the review and approval activities that take place throughout the project lifecycle.

## 1.3 Abbreviations

| Term           | Description                         |
|----------------|-------------------------------------|
| <b>FCM</b>     | Firebase Cloud Messaging            |
| <b>TTS</b>     | Text-to-Speech                      |
| <b>OCR</b>     | Optical Character Recognition       |
| <b>API</b>     | Application Programming Interface   |
| <b>AI</b>      | Artificial Intelligence             |
| <b>REST</b>    | Representational State Transfer     |
| <b>HTTPS</b>   | Hyper Text Transfer Protocol Secure |
| <b>SSL</b>     | Secure Sockets Layer                |
| <b>TLS</b>     | Transport Layer Security            |
| <b>MongoDB</b> | Mongo Database                      |
| <b>JS</b>      | JavaScript                          |

|                                          |                  |
|------------------------------------------|------------------|

## 2. Overall System Description

---

### 2.1 Project Background

Medication non-adherence remains a common and serious issue that affects how well patients respond to treatment. People often skip or delay doses simply because their day gets busy, they forget, or they have no dependable way of being reminded. DVAGO currently functions as a digital pharmacy platform but does not yet offer a dedicated reminder feature for managing medicine schedules. This project introduces a mobile application that fills that gap by giving users automated reminders, timely notifications, and an optional AI-based scanning feature that recognizes medicine names directly from packaging, making the overall experience faster and more convenient.

### 2.2 Problem Statement

Many patients struggle to stick to their prescribed medication schedules, mainly because they forget or have no reliable system to remind them. This results in missed doses, incorrect timing, and weaker treatment outcomes overall. What is needed is a simple, dependable mobile application that helps users keep track of their medicines without adding extra effort to their daily routine.

### 2.3 Project Scope

This project covers the design and development of a mobile-based medicine reminder application. It includes user authentication, the ability to schedule medicine reminders, push notifications, voice-based alerts, AI-assisted medicine name recognition, and a history log of past reminders. The application is being built for both Android and iOS so that it remains accessible to as many users as possible.

### 2.4 Not In Scope

This project does not cover online medicine ordering, payment processing, or any direct integration with DVAGO's live production systems. Features that fall under advanced AI use, such as medical diagnosis, predictive health analytics, or real-time interaction with a pharmacist, are also excluded from the current phase of the project.

### 2.5 Project Objectives

The main goal of this project is to help users stay on top of their medication schedules through reminders that are both automated and timely. Beyond that, the project also aims to make the reminder setup process simpler by allowing AI-based scanning of medicine packaging, to give users flexibility in how they receive notifications, and to build an interface that feels intuitive and easy to use from the very first interaction.

### 2.6 Stakeholders & Affected Groups

The key stakeholders for this project are the development team members, Abdul Ghani (Team Lead) and Syed Anas Ali (Team Member), together with the project supervisor and co-supervisor, who guide the work and evaluate its progress.

The primary affected group is made up of patients who would use the application to manage their medicine intake. DVAGO is treated as a conceptual stakeholder in this project, since the proposed system is consistent with its broader vision for digital healthcare.

## **2.7 Operating Environment**

The application is intended to run on Android mobile devices. Backend services will be hosted using Firebase together with Node.js, and a stable internet connection is required to support notifications, authentication, and the AI-based scanning feature. The system has been designed to perform reliably across the range of mobile environments it is expected to support.

## **2.8 System Constraints**

The system's behaviour depends on the permissions a user grants for notifications and on the resources available on their device. The accuracy of the AI-based medicine recognition feature is affected by factors such as image clarity and lighting at the time of scanning. A continuous internet connection is also required to support the cloud-based services and external APIs that the application relies on.

## **2.9 Assumptions & Dependencies**

Assumptions:

- Users own a smartphone running Android.
- Users are willing to grant the permissions needed for notifications and camera access.
- A working internet connection is available to support the application's core features.

Dependencies:

- Continued availability and reliability of Firebase services.
- Accessibility of the external APIs that support the application's features.

## 3. External Interface Requirements

---

### 3.1 Hardware Interfaces

The system requires the following hardware interfaces:

Logical Structure:

- The application runs primarily on smartphones (Android) for all end-user interactions.
- The device camera is used to scan medicine packaging for AI-based recognition.
- The device speaker is used to deliver voice-based reminders and alerts.
- Testing on additional mobile devices is supported where needed to confirm compatibility and responsiveness.

Physical Addresses:

- The system does not rely on any specific hardware addresses, since it runs through mobile applications and cloud-based services.
- Devices need an active internet connection to stay synchronized with the Firebase backend in real time.

Expected Behavior:

- User devices should perform smoothly while scanning medicines, receiving notifications, and processing scheduled reminders.
- The system is expected to remain responsive across the range of supported devices, maintaining efficiency and reliability regardless of the specific hardware in use.

### 3.2 Software Interfaces

The system interfaces with the following software and services:

Name of Application: Firebase Authentication

- External Owner: Google
- Interface Details: Manages secure user registration, login, and session handling. The mobile application communicates with this service through the Firebase SDKs integrated into the codebase.

Name of Application: Firebase Cloud Messaging (FCM)

- External Owner: Google
- Interface Details: Delivers push notifications for medicine reminders and related alerts. Messages are dispatched to the user's device through the FCM API.

Name of Application: MongoDB Atlas Database

- External Owner: MongoDB Inc.
- Interface Details: Stores user profiles, medicine schedules, and reminder history. The backend connects to this database through secure drivers built into the server-side code.

### **3.3 Communications Interfaces**

The system depends on the following communication interfaces to keep the application, external services, and devices working together smoothly:

Internet Connection:

- A stable internet connection is required for the mobile application to communicate with cloud services such as Firebase and other connected APIs.

API Communication:

- Communication with external services, including Firebase, takes place using RESTful HTTP requests over HTTPS, which keeps data transfer secure and reliable.

Client-Server Interaction:

- The mobile application communicates with the backend, made up of Firebase and MongoDB, through HTTPS requests. Real-time updates, notifications, and medicine reminders are handled efficiently through Firebase Cloud Messaging.

Data Storage and Retrieval:

- The backend securely stores and retrieves user data, medication schedules, and alert logs using Firebase and MongoDB, with encrypted channels maintaining data integrity and confidentiality.

Local Testing Environment:

- During development, the application can be tested on local networks or emulators to confirm that scanning, notifications, and database interactions are working as expected.

Communication Security:

- All communication interfaces use SSL/TLS encryption to keep sensitive user information, including health-related data and reminders, secure during transmission.

## 4. System Functions / Functional Requirements

### 4.1 System Functions

This section describes the core functions of the DVAGO Smart Medicine Reminder System. System functions describe what the system is expected to do and were identified through the requirement-gathering process. Each function can be validated against the statement: "The system should do <X>."

The functions below are grouped logically and categorized according to their visibility and importance.

| Function Category | Meaning                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------|
| <b>Evident</b>    | User-facing functions that the user is directly aware of.                                    |
| <b>Hidden</b>     | Background functions that support the system but remain invisible to the user.               |
| <b>Frill</b>      | Optional functions that could be added in future versions without affecting the core system. |

| Ref #     | Functions                          | Category | Attribute                | Details & Boundary Constraints                                                               |
|-----------|------------------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------|
| <b>R1</b> | User Registration & Login          | Evident  | System Response Time     | User authentication should be completed within 3 seconds under normal conditions.            |
| <b>R2</b> | Medicine Reminder Scheduling       | Evident  | Usability                | Users should be able to schedule reminders with minimal input steps.                         |
| <b>R3</b> | Push Notification Delivery         | Evident  | Notification Reliability | Notifications should be delivered at the scheduled time with a tolerance of $\pm 5$ seconds. |
| <b>R4</b> | Voice Alert Notification           | Evident  | Audio Output             | Voice alerts should be clearly audible and triggered with each reminder.                     |
| <b>R5</b> | AI-based Medicine Name Recognition | Evident  | Accuracy                 | Medicine name extraction accuracy depends on image clarity and lighting conditions.          |
| <b>R6</b> | Reminder History Storage           | Hidden   | Data Persistence         | Reminder logs must be stored securely and retrievable on demand.                             |

|           |                              |       |             |                                                             |
|-----------|------------------------------|-------|-------------|-------------------------------------------------------------|
| <b>R7</b> | Admin Monitoring<br>(Future) | Frill | Scalability | Optional feature planned for future versions of the system. |
|-----------|------------------------------|-------|-------------|-------------------------------------------------------------|

## System Attributes / Non-functional Requirements

System attributes describe the overall quality characteristics of the application. Unlike system functions, these attributes are not specific actions but instead describe how well the system carries out its functions.

Attribute Categories

- Mandatory: Essential for the system to operate correctly and reliably.
- Optional: Improves usability or overall experience without being critical to core operation.

| Attribute                       | Details and Boundary Constraints                                                                                  | Category  |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------|-----------|
| <b>Response Time</b>            | The system must process reminder creation, updates, and retrieval within 2 seconds under normal usage conditions. | Mandatory |
| <b>Notification Reliability</b> | Scheduled reminders must trigger notifications without failure, provided device permissions are enabled.          | Mandatory |
| <b>Concurrent User Load</b>     | The system should support a minimum of 100 concurrent users without performance degradation.                      | Mandatory |
| <b>Data Security</b>            | User data must be transmitted and stored using encrypted communication.                                           | Mandatory |
| <b>AI Recognition Accuracy</b>  | Medicine recognition accuracy depends on image quality; acceptable performance is expected for clear images.      | Optional  |
| <b>Scalability</b>              | The system should be able to scale to support increased users and reminders in future versions.                   | Mandatory |
| <b>Interface Metaphor</b>       | The application should provide a mobile-based graphical user interface (GUI) with intuitive navigation.           | Optional  |
| <b>Accessibility</b>            | The system should support basic accessibility features such as readable fonts and voice alerts.                   | Mandatory |

## 4.2 Use Cases

This section describes the system's functional behaviour from the user's perspective. It identifies the actors who interact with the system, lists the use cases within the system boundary, and documents the most essential use case using a structured description.

### 4.2.1 List of Actors

| Actor | Description |
|-------|-------------|
|-------|-------------|

|                             |                                                                                                                                            |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>End User (Patient)</b>   | The primary user of the application, responsible for managing medicine reminders, receiving notifications, and reviewing reminder history. |
| <b>Admin (Future Scope)</b> | A DVAGO internal stakeholder responsible for monitoring system usage and configuration, relevant only in limited or future use.            |

#### 4.2.2 List of Use Cases

| <b>Use Case</b>                      | <b>Brief Description</b>                                                                                   |
|--------------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>User Registration &amp; Login</b> | Allows users to create an account and log in to the application securely.                                  |
| <b>Add Medicine Reminder</b>         | Lets users schedule medicine reminders by specifying time and frequency.                                   |
| <b>Scan Medicine</b>                 | Allows users to scan medicine packaging so the system can detect the medicine name automatically using AI. |
| <b>Receive Notification</b>          | Delivers push and voice notifications at the scheduled reminder times.                                     |
| <b>View Reminder History</b>         | Lets users review both past and upcoming medicine reminders.                                               |
| <b>Manage Notification Settings</b>  | Enables users to adjust their reminder preferences to suit their needs.                                    |

|                                          |                  |
|------------------------------------------|------------------|

#### 4.2.4 Description of Use Cases

Section: Main

|                          |                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Section:</b>          | Main                                                                                                                                                                                                               |
| <b>Name:</b>             | Add Medicine Reminder                                                                                                                                                                                              |
| <b>Actors:</b>           | End User (Patient)                                                                                                                                                                                                 |
| <b>Purpose:</b>          | To allow users to create and schedule reminders for taking their medicines.                                                                                                                                        |
| <b>Description:</b>      | The user creates a new medicine reminder either by entering the medicine details manually or by scanning the medicine packaging. The system then saves the reminder and schedules the corresponding notifications. |
| <b>Cross References:</b> | Functions: R2, R3, R4, R5<br>Use Cases: User Registration & Login                                                                                                                                                  |

|                                   |                                                                                                                                  |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Pre-Conditions</b>             | The user must be registered and logged into the system.<br>The system must have access to the required notification permissions. |
| <b>Successful Post-Conditions</b> | The medicine reminder is saved successfully.<br>Notifications and voice alerts are scheduled at the specified times.             |
| <b>Failure Post-Conditions</b>    | The reminder is not saved.<br>The system displays an error message and prompts the user to try again.                            |

| Typical Course of Events                           |                                                      |
|----------------------------------------------------|------------------------------------------------------|
| Actor Action                                       | System Response                                      |
| User selects "Add Medicine Reminder" option        | System displays the reminder input form.             |
| User enters medicine details or scans the medicine | System processes the manual input or the AI scan.    |
| User selects the reminder time and frequency       | System validates the reminder details entered.       |
| User confirms the reminder                         | System saves the reminder.                           |
|                                                    | System schedules the notifications and voice alerts. |

### Alternative Course

- Step 2: If the scan fails because of poor image quality, the system prompts the user to enter the medicine details manually instead.
- Step 3: If an invalid time or frequency is selected, the system displays a validation error and asks the user to correct it.

## 5. Non-Functional Requirements

---

### 5.1 Performance Requirements

The system is designed to remain responsive and timely for everyday use.

- Medicine reminders and notifications should be delivered at the scheduled time without any noticeable delay.
- AI-based medicine scanning should process and return results within a reasonable response time under normal network conditions.
- Core application features should respond smoothly during regular use, without any drop in performance.

### 5.2 Safety Requirements

The system must operate safely and avoid any behaviour that could negatively affect the user.

- The application must not trigger incorrect or unintended system actions.
- Users must retain full control over their notification settings, including the ability to enable, disable, or modify reminder preferences at any time.
- The system should handle errors gracefully, displaying clear messages instead of crashing.

### 5.3 Security Requirements

Security measures are essential to protect user data and privacy.

- User authentication must be handled securely through Firebase Authentication.
- All data transmitted between the application and the backend services must be encrypted using secure protocols (HTTPS).
- Access to user data must be limited strictly to authorised users.

### 5.4 Reliability Requirements

The system must always offer consistent and dependable operation.

- Medicine reminders must remain intact even after the application restarts or the device is temporarily shut down.
- User data and reminder schedules must stay consistent and accurate across sessions.
- The system should recover automatically from minor failures without any loss of data.

### 5.5 Usability Requirements

The application must be easy to use and accessible to a broad range of users.

- The user interface should remain simple, clear, and easy to navigate.

- Setting up a reminder should require minimal steps to keep user effort low.
- Visual clarity and readable text should be maintained throughout for a better overall experience.

## **5.6 Supportability Requirements**

The system should remain maintainable and adaptable as future improvements are introduced.

- The application should follow modular architecture that supports ongoing updates and maintenance.
- Future enhancements, such as additional reminder types or admin monitoring, should be straightforward to integrate.
- Code should follow standard development practices to keep debugging and testing manageable.

## **5.7 User Documentation**

Clear documentation must be available to support users as they use the application.

- The application should include in-app help and guidance for its core features.
- Basic instructions should be provided to help users understand how reminder setup and notifications work.
- User guidance should be kept up to date as new features are introduced.
